

How to use SkyFi and Skysafari on TTS-160 Panther and TTS-300 Mammoth mounts

SkyFi and Skysafari works smoothly with TTS mounts. When connected the Skysafari app and the mount handpad works in parallel and can both be used as wished. Using the map on the app makes observing great fun and leads the way to many new objects.

How to connect the SkyFi adapter

1. Connect the adapter to the port labeled PC on the mount head. Use the cable that comes with the SkyFi 3.

2. Place the SkyFi adapter on the magnetic holder (SkyFi adapters from TTS is prepared for this) or secure it with the Velcro band.

How to startup using Sky Safari

1. Align the mount as normal (1 or 2 stars as wished) using the handpad. Leave the mount in the operation screen (not in the menu system)
2. Power up the SkyFi adapter
3. On your mobile device connect to the network called "SkyFi".
4. Start the SkySafari app
5. Goto the settings tab and select (only needed first run):
 - a. Scope type: *Meade LX-200 Classic*
 - b. Mount type: *Alt-Az goto*
6. Any other parameter to setup is described in the SkyFi user manual
7. Open the telescope tab and push connect.
8. Skysafari now connects and can show the scope position and can do goto's etc.

Good luck observing new exiting objects!
